## Manage Repositories

- [Synopsis](#)
- [Parameters](#)
- [Notes](#)
- [Examples](#)
- [Return Values](#)

## Synopsis

- Create and manage repositories

## Requirements

- requests

## Parameters

Parameter	Choices/Defaults	Comments
<b>ansible_collection_requirements</b> string		Contents of requirement yaml file to sync from URL
<b>arch</b> string		Architecture of content in the repository Set to <b>noarch</b> to disable the architecture restriction again.
<b>auto_enabled</b> boolean	<b>Choices:</b> <ul style="list-style-type: none"><li>• no</li><li>• yes</li></ul>	repositories will be automatically enabled on a registered host subscribed to this product
<b>checksum_type</b> string	<b>Choices:</b> <ul style="list-style-type: none"><li>• sha1</li><li>• sha256</li></ul>	Checksum of the repository

<b>content_type</b> string / required	<b>Choices:</b> <ul style="list-style-type: none"> <li>• deb</li> <li>• docker</li> <li>• file</li> <li>• ostree</li> <li>• puppet</li> <li>• yum</li> <li>• ansible_collection</li> </ul>	The content type of the repository
<b>deb_architectures</b> string		comma separated list of architectures to be synced from deb-archive only available for <i>content_type=deb</i>
<b>deb_components</b> string		comma separated list of repo components to be synced from deb-archive only available for <i>content_type=deb</i>
<b>deb_errata_url</b> string		URL to sync Debian or Ubuntu errata information from only available on Orcharhino only available for <i>content_type=deb</i>
<b>deb_releases</b> string		comma separated list of releases to be synced from deb-archive only available for <i>content_type=deb</i>
<b>description</b> string		Description of the repository
<b>docker_tags_whitelist</b> list / elements =string		list of tags to sync for Container Image repository only available for <i>content_type=docker</i>
<b>docker_upstream_name</b> string		name of the upstream docker repository

		only available for <i>content_type=docker</i>
<b>download_concurrency</b> integer		download concurrency for sync from upstream as the API does not return this value, this will break idempotence for this module
<b>download_policy</b> string	<b>Choices:</b> <ul style="list-style-type: none"> <li>• background</li> <li>• immediate</li> <li>• on_demand</li> </ul>	download policy for sync from upstream
<b>gpg_key</b> string		Repository GPG key
<b>http_proxy</b> string		Name of the http proxy to use for content syncing Should be combined with <i>http_proxy_policy='use_selected_http_proxy'</i>
<b>http_proxy_policy</b> string	<b>Choices:</b> <ul style="list-style-type: none"> <li>• global_default_http_proxy</li> <li>• none</li> <li>• use_selected_http_proxy</li> </ul>	Which proxy to use for content syncing
<b>ignorable_content</b> list / elements =string		List of content units to ignore while syncing a yum repository. Must be subset of rpm,drpm,srpm,distribution,erratum.
<b>ignore_global_proxy</b> boolean	<b>Choices:</b> <ul style="list-style-type: none"> <li>• no</li> <li>• yes</li> </ul>	Whether content sync should use or ignore the global http proxy setting This is deprecated with Katello 3.13

		It has been superseded by <i>http_proxy_policy</i>
<b>label</b> string		label of the repository
<b>mirror_on_sync</b> boolean	<b>Choices:</b> <ul style="list-style-type: none"> <li>no</li> <li>yes ←</li> </ul>	toggle "mirror on sync" where the state of the repository mirrors that of the upstream repository at sync time
<b>name</b> string / required		Name of the repository
<b>organization</b> string / required		Organization that the entity is in
<b>os_versions</b> list / elements =string	<b>Choices:</b> <ul style="list-style-type: none"> <li>rhel-6</li> <li>rhel-7</li> <li>rhel-8</li> </ul>	Identifies whether the repository should be disabled on a client with a non-matching OS version. A maximum of one OS version can be selected. Set to [] to disable filtering again.
<b>password</b> string / required		Password of the user accessing the Foreman server. If the value is not specified in the task, the value of environment variable <code>SATELLITE_PASSWORD</code> will be used instead.
<b>product</b> string / required		Product to which the repository lives in
<b>server_url</b> string / required		URL of the Foreman server. If the value is not specified in the task, the value of environment variable <code>SATELLITE_SERVER_URL</code> will be used instead.

<b>ssl_ca_cert</b> string		Repository SSL CA certificate
<b>ssl_client_cert</b> string		Repository SSL client certificate
<b>ssl_client_key</b> string		Repository SSL client private key
<b>state</b> string	<b>Choices:</b> <ul style="list-style-type: none"> <li>• present ←</li> <li>• present_with_defaults</li> <li>• absent</li> </ul>	State of the entity present_with_defaults will ensure the entity exists, but won't update existing ones
<b>unprotected</b> boolean	<b>Choices:</b> <ul style="list-style-type: none"> <li>• no</li> <li>• yes</li> </ul>	publish the repository via HTTP
<b>upstream_password</b> string		password to access upstream repository
<b>upstream_username</b> string		username to access upstream repository
<b>url</b> string		Repository URL to sync from
<b>username</b> string / required		Username accessing the Foreman server. If the value is not specified in the task, the value of environment variable SATELLITE_USERNAME will be used instead.
<b>validate_certs</b> boolean	<b>Choices:</b> <ul style="list-style-type: none"> <li>• no</li> <li>• yes ←</li> </ul>	Whether or not to verify the TLS certificates of the Foreman server.

		<p>If the value is not specified in the task, the value of environment variable <code>SATELLITE_VALIDATE_CERTS</code> will be used instead.</p>
<b>verify_ssl_on_sync</b> boolean	<b>Choices:</b> <ul style="list-style-type: none"> <li>no</li> <li>yes</li> </ul>	verify the upstream certificates are signed by a trusted CA

## Notes

- You can configure certain aspects of existing Red Hat Repositories (like *download\_policy*) using this module, but you can't create (enable) or delete (disable) them.
- If you want to enable or disable Red Hat Repositories available through your subscription, please use the `redhat.satellite.repository_set` module instead.

## Examples

```
- name: "Create repository"
  redhat.satellite.repository:
    username: "admin"
    password: "changeme"
    server_url: "https://satellite.example.com"
    name: "My repository"
    state: present
    content_type: "yum"
    product: "My Product"
    organization: "Default Organization"
    url: "http://yum.theforeman.org/plugins/latest/el7/x86_64/"
    mirror_on_sync: true
    download_policy: background
```

```
- name: "Create repository with content credentials"
  redhat.satellite.repository:
    username: "admin"
    password: "changeme"
    server_url: "https://satellite.example.com"
```

name: "My repository 2"  
state: present  
content\_type: "yum"  
product: "My Product"  
organization: "Default Organization"  
url: "http://yum.theforeman.org/releases/latest/el7/x86\_64/"  
download\_policy: background  
mirror\_on\_sync: true  
gpg\_key: RPM-GPG-KEY-my-product2

## Return Values

Key	Returned	Description
entity (dict)	success	Final state of the affected entities grouped by their type.
repositories (list)		List of repositories.
